SUMMARY OF DISCUSSION

Keith called me to follow up on a question I asked him the previous day (June 19, 2014). I had asked Keith if it was acceptable to calculate separate groundwater exposure point concentrations (EPC) for the up- and downgradient portions of each of the two groundwater plumes at the East Troy Contaminated Aquifer (ETCA) site. Keith said that he had confirmed that it was acceptable to calculate and to use separate up- and downgradient groundwater EPCs. Keith also said that the risk assessment should note that the higher concentrations in the upgradient portion of the plumes may migrate in the future. This point should be touched as part of the interpretation of the risk/hazard results.
